Other Site Characteristics

Il sito include quattro laghetti di diverse dimensioni ed in collegamento fra di loro. Essi hanno origine artificiale (scavo di vecchie torbiere). Uno di essi era adibito alla pesca sportiva, gli altri invece hanno visto una progressiva rinaturazione spontanea delle sponde arborate.

4.2 Quality and importance

Questa zona umida si trova all'interno di un'area bonificata con alte potenzialità faunistiche in caso di ripristino. Ospita numerose specie in transito spesso rare od eccezionali per l'area geografica, nonché alcune coppie nidificanti di specie prioritarie quali *Ixobrychus minutus*, *Lanius collurio* e *Circus aeruginosus*. La fauna ad anfibi e rettili dell'area è ben nota, grazie a cospicui campionamenti degli anni '90 non ancora pubblicati. Nell'area sono abbondanti diverse specie di grande pregio (*Bombina variegata*, *Rana latastei*, *Triturus carnifex*, *Emys orbicularis*), in una comunità erpetologica che annovera anche molte altre specie di allegato IV (*Rana dalmatina*, *Zamenis longissimus*, ecc.). Una cospicua serie di campionamenti ancora inediti ha riguardato anche la comunità di micromammiferi, particolarmente notevole sia per l'abbondanza di arvicola terrestre italiana (*Arvicola terrestris italicus*), sia per la grande concentrazione di toporagno acquatico di Miller *Neomys anomalus*, che popola abbondante le splendide zone umide paranaturali situate alle origini del T. Versa. Nella zona sono abbastanza diffusi il gatto selvatico *Felis s. silvestris* e la puzzola *Mustela putorius*.
